Online Assessment

Performance

Processing style

Further Details

Items in the test	42
Number of correct responses	30
Number of incorrect responses	10
Responses with wrong data source in front	0
Correct responses with wrong data source in front	0
Items attempted	40
Solved items as a percentage of attempted items	75 %
Language of Administration	German
Norm group:	General adult population

Guidelines for Interpretation

Performance

The assessment of the performance of a participant and therefore the level of verbal reasoning is based on the number of correct responses less the half number of incorrect responses that have been produced by the participant during the test. Herefrom, the raw score (RS) of a participant is calculated. The raw score is benchmarked against a comparison group in order to classify the participant's performance. For this benchmark comparison t-scores and percentiles (%ile) are calculated.

The percentile indicates the proportion of people in the comparison group with a raw score lower than that of the participant. A percentile of say 70 means that the performance of the participant is higher than the performance of 70% of the comparison group and lower than the performance of 30% of the comparison group.

The t-score is a linear transformation based on the comparison of the raw score with the comparison group. The mean of the t-score is 50. T-scores between 44 and 56 are interpreted as average. T-scores above 56 and below 44 are interpreted as above and below average respectively. For example: a participant with a t-score of 58 has a level of verbal reasoning above average benchmarked against the comparison group. T-scores under 38 and above 62 are interpreted as highly below and highly above average respectively.

'responses with wrong data source in front' indicate how much in line with instructions the participant has completed the instrument. 'correct responses with wrong data source in front' shows the raw score of right answers with a wrong data source in front, i.e. those not in line with instructions.

Processing Style

The processing style is defined by the two dimensions speed (quick vs. slow) and accuracy (accurate vs. careless). The raw score of the dimension speed results from the number of items attempted. The raw score of accuracy results from the number of items completed correctly compared to the number of items attempted.

The raw scores of speed and accuracy are benchmarked against a comparison group and mapped on a scale from 1 to 9. The higher the scores are on these two dimensions, the faster and more accurate will the processing style of the participant emerge when related to the comparison group. The chart shows the participant's scores. The scale „accurate vs. careless“ is the horizontal orientation in the chart and the scale „quick vs. slow“ is the vertical orientation in the chart. The participant's score on the two dimensions is indicated by a colored dot.
